

SAP S/4HANA

EXTENDED PROFILE

OVERVIEW

SAP S/4HANA is a modular ERP offering large-scale integration of different business functions across an organization. It works to cover all day-to-day processes and offers integration with other data silos, including CRM.

SAP S/4HANA is a business suite of software that moves beyond mere interconnectivity towards offering real-time data and decision-making support, using both internal and external sources of data. One such decision-making process that the software offers is the ability to draw data together to calculate the value of individual business cases. This can be scaled up as far as simplifying the process of calculating the value of the business as a whole.

SAP S/4HANA can be delivered as a cloud solution or installed on-premise and can be either an upgrade of previous SAP ERP software - which can be installed in around six months - or a new entirely customized solution. This means that a team comes in and builds from the ground up. This option offers a cleaner and clearer software solution but can take substantially longer.

The change in the modeling of data, which allows for decision-making functions, requires a full migration of data. This can be time-consuming whether working with a previous SAP product or starting from scratch.
